Step 1 — Turn on monitor

- Turn the monitor on by pushing the 12V DC fuse into the fuse holder.

The pump/s starts and the ePC boots up with a series of beeps. The status LED lights on the modules, embedded PC and modem (if fitted) turn green.

Step 2 — Turn off monitor

- Turn the monitor off by pushing the fuse into the fuse holder.

When the fuse is out, the internal fan continues to circulate air inside the box because it is powered by a different power supply.
