INTRODUCTION

Events provide contextual information related to alerts triggered in OneView.

Each Event contains information to help users review:

- what triggered the event
- when the event occurred
- associated monitoring data
- notification delivery history
- event updates and attachments

Events are accessed from the Events table within a OneView project.

Step 1 — Open the Events Table

- Open your project in OneView
- Navigate to **Events** from the project side navigation menu
- The Events table displays all events associated with the project
- The table supports filtering, sorting, and searching

Step 2 — Open an Event

- Select an event from the Events table to open the Event Details page
- Use the left-hand navigation menu to move between sections of the event
- The following sections may be available:
 - Details
 - Data
 - Delivery log
 - History

Step 3 — Review Event Conditions & Timeline

- The **Event Conditions** section provides information about the alert that created the event.
- Clicking the [Alert rule](#) hyperlink will take you to the alert that created the event.
- The **Event Timeline** section provides a record of when the event occurred and when notifications were generated.

Step 4 — Review Event Data

- The **Data** tab provides contextual monitoring data associated with the event. Depending on the event type, this may include:
 - monitoring location maps
 - pollutant and environmental data charts
 - battery voltage data charts
- The alert chart will also include annotations showing:
 - trigger threshold
 - reset threshold
 - event timeline markers

Step 5 — Review Delivery Logs

- The **Delivery log** tab displays the notification delivery history for the event.

Step 6 — Review Event History

- The **History** tab provides an audit history of changes made to the event.
- This includes:
 - status and priority updates
 - attachment uploads and removals
 - updates to event details
